Comments: I am for the proposed actions to cut timber on the 3,000 proposed acres. Since old growth does not hold the same value of carbon as younger and middle aged forests, the value of these trees as timber resources is greater than their value as carbon sequesters. In addition, the location of this project provides retained aesthetic appeal, as the cutting units are designated in a spread-out fashion. This will enhance sustainable logging as not all impacts will be made in one location and the visual appeal can be maintained across a landscape. In addition to the positive ecological impacts that this sale can have, the timber cut from this land will stimulate the local markets and provide sustainable goods.
