Comments: Please understand that class 1 e-bikes do not have a throttle so they cannot "roost" the trail. They are limited to 250 Watts and only provide power according to how hard the rider presses on the pedals. A world class rider can maintain 450 watts for an hour and sprint specialists can peak to 2,000 Watts for 30 seconds for reference. A 250 Watt e-bike does not exceed the realm of natural human performance. They are not "motor vehicles". They merely allow a below average rider to partake in a trail fitness program that they would otherwise not be able to accomplish. And allow groups of varying fitness/ ages to stay together. E-bikes are a fantastic advent in order to get more people outdoors to a healthy lifestyle. They do not require any differential trail designation and should be allowed and promoted for any multi-use trail where bicycles are allowed. They are also an indispensable improvement for urban commuting and delivery and should be considered the way of the future as we leave fossil Carbon fuel behind either by decision or depletion.
