Title:

Comments: i visited the Stibnite Mine this year through a tour organized by the city Club of Boise. I was impressed by the plans that Midas gold has for restoring a Brownfield site to its natural setting by removing the tailing piles and restoring the natural channel of Blowout Creek, the headwaters of the South Fork of the Salmon River.

Modern methods, plans, and processes used by mining companies will significantly reduce and possibly eliminate the sediments that now pollute the water due to existing tailing piles. The special fish passage channel will isolate the creek water from the tailing's removal process eliminating the migration of sediments into the creek.

this is a project that should be approved and move forward with best possible speed.
