Comments: Just limit the amount of power that one can use to 750 watts. I own a 1000 and a 1500 watt bike. Really the 1000 watt would be fine as it does not break traction even though I only weigh 170 pounds. Every ebike I've used could be limited or governed to the 750 watts. 750 watts is plenty of power to help even larger people get up a steep grade without causing anymore erosion than any other mountain bike. I think I could argue that the added weight may actually cause more compaction and prevent some erosion if anything. We need to get people outside and exercising to help with the opioid epidemic, heroin epidemic, health care cost and every other negative that's produced from people sitting around engulfed in fantasy ie reality tv, Facebook, tiktok, videogames etc. It's shocking to me that people who are all about nature snub there nose at electric bikes like it's a nasty gasoline motor. I've got news for you. Erosion is natural. You're attempt to override mother nature is futile and unnatural. What makes me sick is all the trash I haul out while enjoying my ebike and paddle adventures. She's going to take back her planet someday, nothing can stop that, so let's share the trails and waters as long as she lets us. Pick up your trash, burn responsibly, and take back the EPA.
