Comments: Non motorized trails need to stay non motorized. Motorized trails get much more erosion, get way more tore up and need much more management. The dangers of multi use between non and motorized are numerous. Hikers, bikers and equine users are at major risk when trails that are designed non motorized are opened up to motorized use.

I also can't stop thinking that many of the non motorized trails are narrow single track trails, and when motorized users begin to use these there has got to be a dangerous increase in fire danger from hot exhaust and other factors.

Thanks for the opportunity to comment
