Title:

Comments: This proposition may seem very smooth and safe but there are an incredible amount of small details that Midas Gold is glossing over which are truly important. Cyanide will be being transported by large trucks down mountain roads in the middle of the night and on icy roads. Several safe drivers in durable cars struggle on the mountain roads in the day time, so imagine truck drivers, carrying tons of poison going around those crazy turns at night. One flase move could upset the whole operation, but by that time it's too late, there is no going back once the cyanie has leak onto the road, into the soil, and into our water system. A kid could be getting a drink in the middle of the night and the cyanide would have seeped into his water system thus poisoning him/her. The biodiversity along the river would be wiped out for years to come detroying people's homes and livelihoods. Why wait for an accident to happen when it could be stopped before people were harmed?
