Comments: E-bikes do not represent any material changes in speeds that danger any user groups. They are not faster than a standard bike down hill due to the added weight. Uphill they provide minimal increases to speed on single track trail. It is truly only on up hill road situations where they are exponentially faster than a traditional bike. Reducing vehicles on forest roads and sharing trails is in the nature of all responsible user groups. I look at the Anacortes community forest lands as a prime example of what we can all attain by allowing everyone to play together.
