Comments: "e-Bikes" are "motorized vehicles" in my opinion. They can travel at speeds traditional (mountain) bikes can not, in particular in up-hill directions. This can, does, and has added to increased friction between the cycling and hiking and equestrian communities. They are nearly silent in any direction, and most notable in up-hill directions. This can be quite surprising to other trail users, including traditional (mountain) cyclists.

I feel that eBikes can and should be allowed where currently other motorized vehicles can operate.

I am a life long (35+ years) mountain biker, so to hear this from me might seem odd. At some point as I "mature" I may need / want the benefits of an eBike. But I still feel they should not be allowed where other human powered cycles are.
