Title:

Comments: I am strongly opposed t the Stibnite GOLD project. The fish spawning and habitat modifications are untested and likely to damage an economically and culturally significant fishery. The impacts on water quality will be significant in the short term. The long term water quality impacts will very damaging as the retention's structures will eventually fail.

This project will create new jobs, but only for the life of the mine and at the cost of the long term viability of our communities and environment.
