Comments: As an employee of a water treatment facility, I personally know the man power and funds it requires to keep a successful treatment facility running. I have grave concerns to the robustness of the proposed water treatment structures and human attributes that must remain in perpetuity to manage the inevitable contamination due to the proposed Stibnite project. What plans have been made to deal with closures or damage to the proposed water treatment site due to wildfires, avalanches, flash floods, etc. Simply assuming that that waste will be treated in perpetuity is not sufficient. I urge you to re-examine a plan, that rests the entire health of the South Fork Salmon River and thus, the main Salmon, and thus, the Columbia, on a water treatment facility, hosted in the backcountry of Idaho, where the effects of nature, can not be accounted for or planned for.

An Idaho tax payer,

Alex Hyman
