Comments: I have reviewed the information available on both the commercial website of the Sandia Peak Ski Area and the Forest Service website regarding the coaster project. I find myself wondering if there is more information about the overall impact as well as the construction process for this coaster.

Specifically how many trees will be removed in order to build structures at the top and to install the downhill run of the coaster as it is shown drawn onto the photograph of the ski area?

I understand from comments made at an open house meeting that concrete footings would be placed to hold the coaster rails. What size would those be, how many would there be and exactly where would they be placed?

Your scoping letter File Code 2720 dated September 2, 2020, states "due to the minimal amount of new disturbance associated with the proposed action." Is there a specific standard for determining the amount of new disturbance? How was that decided?

Is there additional detailed construction information available to the public in another location?

Thank you in advance for your responses to my questions. I am a local land owner and user of the national forest.
