Title:
Comments: The project should focus on resiliency by leaving trees as a carbon sink, especially trees of all species over 19 inches in diameter at breast height, which store much more carbon than smaller trees. Riparian areas, wildlife corridors, and the National Recreation Area should be left in an undisturbed state to support natural processes of growth and decay. Decommission old roads so they cannot be accessed by off road vehicles. This protects riparian areas from silt and erosion runoff from the roads. It also protects wildlife from undo disturbance by people & their vehicles. Do not build any new roads. Roads increase the chance of invasive species invading an area and create an "edge" effect which harms some wildlife. Fix up present campgrounds. Limit or eliminate livestock grazing in the area to reduce its harmful effects.
