Comments: I strongly object to allowing increased grazing in wilderness. I urge that a full assessment of environmental impacts of all grazing be provided and that those impacts be governed within significant protections to keep our natural resources preserved fully. With this era of climate change we must work harder to protect species and land so as to keep them sustainable. Species recovery is a priority over grazing and the latter must not hinder the recovery. I strongly believe it is best for grazing to be greatly reduced rather than expanded for best environmental vitality and sustainability. We are quickly finding our human life in need of a more active, enhanced environment, with forests protected from drought and fires, water protected for good health and sustainability, and species vibrant. Exploitation must be restrained. Recent study has shown that 97% of the earth no longer holds the life it once knew. We must do more for recovery and less to exploit for human use. Grazing is a major cost that must be contained.
