Title:

Comments: In the 1960s our understanding of the damage to wilderness done by cattle and sheep grazing in wilderness and forested areas was less well developed. We now know that the environmental damage from such grazing impacts our already fragile ecosystems. Methane from cattle can be more harmful than CO2 emissions. Animal waste endangers water supplies. Invasive weeds follow livestock grazing. Our forests and wilderness areas should be protected and not deemed to be just another commodity available to the highest bidder.
