Comments: Cattle are not native to the United States. Our ecosystems are not designed to accommodate them. I have personally seen the damage done to an otherwise pristine mountain river by cattle. It sickened me. And cattle do not graze in harmony with their environment, disrupting the balance of flora in ecosystems.

In addition, cattle do not come alone. They come with fences that disrupt daily and migratory patterns of wildlife. They also come with "Rangeland Management", a facetious term for the slaughter of predatory species who are vital to keeping herds of prey ruminants healthy and prevent them from overpopulating their ecosystem and threatening its balance. Predatory species also keep rodents and other species in check.

"Rangeland Management" also comes with bulldozers that mow down trees that have stood for centuries to facilitate the growth of grazing flora. And it is an excuse to remove species that compete for grazing, usually by methods that are inhumane.

We have spent millions of taxpayers dollars to "Manage" rangeland to accommodate a handful of cattle owners. And we have then had to spend millions more to restore damage done to flora and fauna in "Managed" ecosystems.

This is insanity!
