Comments: Dear Supervisor Birkey and August Phase 1 Planning Team,

For decades scientific research explicitly shows that logging in fire-affected forests is ecologically the worst thing you can do for every aspect of the environment, and would likely increase future risk of fire in these watersheds.

I love the Wild and Scenic South Fork Trinity River and I value post-fire landscapes.

The thousands of acres of logging and multiple roads would harm water quality, soil, regeneration, wildlife, salmon, and other aquatic life. Additionally the visual quality in these watersheds would be ruined by these invasive projects. The environmental assessment offers little to no real data to support the claims that this project would be insignificant.

Please protect and work towards the recovery of struggling salmon and wildlife populations, water quality, habitat connectivity and visual quality in the already impaired South Fork Trinity River.

I urge you to forgo this massive logging project and focus on public safety. Focusing solely on imminent hazard trees (that are completely dead), and only around recreation sites and on major roads, not the entire 922 acres of roadside logging, as proposed in Alternative 2, is our best option for a healthy and safe watershed.

Sincerely,
Bojan Ingle
