Title:

Comments: Thank You for using a programmatic EA and for committing to designate areas to manage for old-growth. Please avoid gridlock by narrowing the project to focus on issues with broad support. The project currently tries to manage all areas, activities, and resources at once, including many areas and activities that will be contentious. We could gain efficiency, do more, and gain support for a broad program of future work by excluding areas that will stir up disagreements and are widely acknowledged as being healthier than other areas. Please limit the scope of the project to:

Exclude Georgia's Mountain Treasures from commercial timber harvests.

Restrict commercial timber harvests to "fire adapted" forest types. Those forest types cover 77% of the Foothills Landscape and include the areas where most people agree active management is most needed.

Exclude areas more than half a mile from a road. "Temporary roads" actually last decades to centuries, and regardless of any good that logging accomplishes, access roads disrupt ground water, fragment habitat, and destroy soil. Stop plans to log in mesic forests.

Please do not cut all trees in attempts to regenerate southern yellow pine. In some southern yellow pine stands. The second harvest is unnecessary and damages forest structure and wildlife habitat value.

Please do not thin in mesic forests. Forests on moist sites naturally have dense canopies.

Manage forests the way they really work: Southern Appalachian forests naturally contain trees of many different ages, species that typically live over 200 years, and young trees growing in response to the death of one or a few trees.

Choose Alternative 3. Alternative 3 excludes areas that the Forest Service's own plan identifies as "unsuitable" for "timber production."
