Comments: Is it possible that in the 21st Century we still use air powerlines to get electricity from one place to another?

They are not practical: heavy snow, rain, wind, rock/mud slides and/or avalanches can drag them down at any moment... and there's no electricity for anyone for a while. Besides the fact that they aren't good to look at; they take up space and resources for wildlife; and give EMF symptoms to people and animals alike.

Underground powerlines would be much better, require much less work to keep them staying good, none of the above problems would be highlighted and they wouldn't be an eye-sore in our whole Valley. Thanks for taking in consideration my points of view as well.
