Comments: I want the Manti-La Sal NF why you want the forest to be free of honey bee apiaries in the new forest plan. Honey bees are introduced bees that due to their social nature and large colony size out-compete with the native bees (many of which are solitary) of the region. In a single month, honey bees take enough pollen from the forest that could support 33,000 solitary bees.

One species native bee in the Manti-La Sal NF includes the imperiled Western Bumblebee and is listed as a Species of Conservation Concern.

I want to see the Conservation Alternative be fully analyzed as one of several alternatives.
