Comments: The Forest Service does incredible and very important work at many locations in this country. However the proposed changes noted here for Big Bear area will have a huge negative impact on the eagles who have been nesting here for the last several years. The pair here now are already starting nesting activities for this coming season; the work proposed will very likely stop their nesting activities here, and force them to find a new area. Please consider the importance of the wildlife here, an integral part of our heritage and this beautiful natural area, and change the plans for updates so as to lesson impact. (no trails going right through the nesting range, hold off on any work till after the eagle's season for mating, nesting, and raising young, and update and review current roosting data before finalizing any plans for changes).

The USFS plans are critical to the survival of the eagles, and what they represent. Please reconsider the current proposal!
