Comments: I assume you can hear me thank you. I know this process is a lot of work but one point that I put this in the question-and-answer one point that hasn't been made in this discussion is that wildlife native plants, etc., have intrinsic value. If public lands don't manage for protection of those resources and I don't even like to call them resources, because I think you know, plants and wild animals don't have a voice and resource resources implies that they are extractable, and I don't agree with that philosophy. They'll certainly not survive climate change and overuse by the public. It's not that I'm not against restoration projects for us restoration projects I've been a member of to CFL RPS since 2012 and spent a lot of time on field trips and learning about what forest restoration is all about and how forest restoration can provide for a much healthier ecosystem, but I do feel like the intrinsic value of what already exists on the land, especially of those back country areas needs to be acknowledged and managed for. So that's my point, thanks.
