Comments: I would like to state my support for the Green Hill Vegetation Project #61112. The regeneration harvests are consistent with the GW Forest Plan and help address the need for increased age-class diversity by creating more early-successional habitat. I support the twenty-acre thinning project and the goals to improve the growth of the residual trees and leave them for their wildlife benefits. The TSI and burning work is also consistent with the forest plan. My only input would be to use the TSI treatment on better-than-average growing sites. I don't believe the cost/benefit supports the practice on poor sites. Providing or improving access to the Moore's Creek State Forest by foot and by administrative vehicles is a good example of working with other agencies, and should also proceed.
