Dear Joan Schmidgall,

Dear Senator Wyden & Merkley

US Forest Service is mandated use of Ecosystem Best Management Principals & Practices. No timber harvests of Old Growth Tree. There is plenty of wood to harvest in young trees. Fire Prevention & Restoration of Ecosystem for All Species is a Core Principal. Carbon storage increases the older the tree. Solid scientific evidence, bigger trees sequester more carbon than young trees. Why are growth rings are so thick? Thicker good years to sequester carbon & thin in drought. Healthy Ecosystem are Diverse with Generations of species for Protection for Indigenous Salmon.

Please consider my comments as you review plans for the proposed Quartzville-Middle Santiam timber project on the Sweet Home Ranger District of the Willamette National Forest. This very special area encompassing the headwaters of Quartzville Creek and the Middle Santiam River should be managed for its ability to provide carbon storage, clean water, air, soil, food & recreation opportunities. In this era of accelerating environmental crises including climate change and biodiversity loss, Forest Service must take seriously your role as caretaker of our Public Lands. If we are to achieve resilient public lands, timber volume can no longer be the primary driver of management decisions in our Pacific Northwest forests. The agency must shift your priorities to preserve our remaining mature and old-growth forests as the priceless carbon stores they are, as well as for their ever-increasing potential to sequester more carbon as they age.

I urge the Forest Supervisor to choose a modified Alternative 4, which would log only stands under 80 years of age and would not employ harmful "regeneration" logging methods. This alternative would still produce 50-60 million board feet of timber but would refrain from any logging activity in the mature forests over 80 years of age that are so crucial to our climate future. Please consider ways to reduce the mileage and impacts of roads in this plan, which can damage watersheds and wildlife habitat, as well as increase fire risk by allowing vehicle access to formerly inaccessible places.

Additionally, the Forest Service should identify units to be dropped from Alternative 4 that contain special features or values as identified in the extensive ground-truthing efforts undertaken by concerned local residents & communicated to the agency in comment letters at each stage of the NEPA process. And, the Forest

Service should go further in analyzing the impacts of this alternative to Northern spotted owls and their habitat, taking into particular consideration how much key habitat was lost in recent wildfires, as well as the complete carbon lifecycle analysis for this project. Finally, I ask the Forest Service to refrain from building more roads into road heavy watersheds and focus its efforts on thinning previously managed, young plantation stands that are accessible from current road system.

Thank you for your consideration

Sincerely,

Cyndi Karp
