Comments: Regarding the capping or plugging of wells, why do you not share the maps and the emissions data of the wells to be plugged. There is so much that the public does not know such as, the history of plugged wells, the Environmental impacts. How can this possibly be approved if the public has not been given this historical data?

Regarding the Wayne's old growth forest and wetlands, the public must be kept informed. The environmental plan as written is essential. If you don't follow it, this will most likely lead to extensive logging and destructive road building. It is essential, we must require protection of old growth forest and wetlands. Please realize we are all dependent on our forests. The Forest Service should not give up its protective oversight. We must follow the science for a new plan. I know the Wayne has a history of logging 60 to 80 year old trees and labeling them mature when the trees actually have life spans of 200-400 years. And we know from reports from environmental scientist the role of old trees to forest health and climate protection is essential. It is a fact that the largest 1% of trees in a forest store about half the forest's carbon. Planting of trees is not going to help us fight climate change now. The Wayne is public land, Be assured, the public cares. The tragic use of our forests have become a life and death situation for the future of our planet. Our forests protect us! We must protect our forests! It is not about the money! it is about life on earth!
