Title:
Comments: Fall almost all dead timber on a contour to stabilize soil. Leave 4 snags per acre for wild life. Leave some piles for wildlife and burn the rest.

Replant entire forest.

Keep 85% of brush down mechanically and with herbicide for about 20 years until the planted trees start to take over with shade.

Continue commercial harvesting to thin planted trees throughout their life cycle.

Repair all roads,landings, and skid trails and keep open for recreation and future fire suppression.

As the forest get reestablished get the whole thing on a four year controlled burn cycle.
