Title:

Comments: All rational people with even a limited knowledge of the science of forest restoration, post fire practice would be offended by the inadequacy of the environmental impact analyses/report that does not seem to bear any relationship to scientific evidence for the proposed decisions.

With such a large project, with so many unknowns, it must have a rigorous environmental impact assessment.

Instead we get a skimpy Environmental Analysis that repeatedly concludes that the proposed logging would not pose any significant impacts--totally laughable and at odds with what the law requires.

Stop all plans until a sufficient environmental impact analysis/report is completed.

Do not persist in ensuring all these areas will be at greater risk of fast moving fire in a year or two (documented in areas of prior fires and their new fires with that approach afterwards).
