Title:

Comments: Sir/Ms,

Thinning by mechanical means as described combined with fire seems a reasonable way to proceed with this project. Looking out my window at the smoke from the ongoing Calf Canyon/Hermit's Peak fires I cannot urge you strongly enough to exercise extreme caution prior to ignition of any and all fires. Winds, air and burnable material moisture contents, air temperatures and any other potential risk factors must be weighed on the extreme conservative side - no ignition if there is more than a 1% chance of the fire escaping its intended control lines. There must be no political or agency pressure on any level to stray from being on on the side of 'most conservative'.

Sincerely,

Al Webster
