Comments: While federal agencies undergo fulfilling mapping efforts for Executive Order 14072, there are actions that the Forest Service can take right now to incorporate climate smart forestry into land management planning. We are continuing to urge leadership in Forest Service Region 6 to meaningfully incorporate the Climate Vulnerability Assessments into planning documents in order to cumulatively and systematically analyze their impacts to landscapes given regionally specific climate predictions. These assessments prove what we already know: that under climate predictions, federal forest lands are critical in providing living climate buffers with clean air, drinking water, flood and erosion control, and fish and wildlife habitat.
