Title:

Comments: In principle there is nothing wrong with Facility Improvement, as long as it's limited to that; improving or rehabbing, and or replacement of the current structures. However, the proposed project significantly and negatively goes beyond those measures and changes the natural environment to such a substantial degree that it should not be approved as currently proposed. A much more scaled back improvement project in keeping with the current natural environment, and the manner in which the current structures blend in would be a fair and appropriate compromise. Accordingly, the project as currently proposed, should be rejected with a scaled back approval of a project that would keep with the current facility status quo of the buildings present, just improved upon.

Should the forest service Approve of the project as currently proposed, then litigation should be initiated to tie this project up in the courts until the developers agree to negotiate in good faith, and a scale back of their proposal with the emphasis being on preservation of the current status quo, and the natural environment surrounding the current structures.

Thank you for your time and consideration.
