Comments: Thank you for considering the following statement :

Rather than a one-size-fits-all landscape-level approach to felling and removing dead trees and snags upon sensitive and recovering fire impacted tree dominated biomes, all management should be site-specific, take into account the ecosystem services provided by large and long lived snags and large down logs, and only fell dead trees less than 100 years old that truly pose a threat to public safety at campgrounds, trailheads, "dispersed" camp sites, "swimming pool" parking areas and very high use sections of forest roads.
