Comments: Especially given the precarious condition of our natural environment in this 21st century, resource extraction, regardless what the resource is, absolutely cannot afford to have a negative impact on ecosystems from alpine to desert, from aquatic to terrestrial. The mining of Stibnite Gold Project is no exception. Actually, if at all possible, the extraction process which involves very dangerous cynanide leaching, should strive to enhance the natural habitat. Any detrimental impact to the fisheries, wildlife, water quality, roadless habitat and wilderness areas of the East Fork South Fork Salmon watershed is not acceptable and should not be considered viable until it can be demonstrated that the mine will not harm all the critical natural resources mentioned above that would be impacted.
