Comments: This proposal will result in simply adding even more devastating ecological damage to our nearly destroyed life support for life as we know it on this planet. Science across the entire world is BEGGING to leave live native trees standing and to leave dead native trees where they fall. We also know from vast accredited and respected Scientific research that unless seed-grown native trees are planted there will be little to no ecological value. To suggest logging native trees to benefit corporate or individual economies is a detrimental choice. Your suggestion to mitigate by planting trees is untrue and a false premise. In order for the ecological benefits of seed-grown native trees to begin it can take anywhere from 5 - 30 years of growth. What is the Forest Service's plan to log the multi-millions of invasive trees across the United States? What is the Forest Service's plan to log the invasive trees for use in a corporate and or individual economic pursuit? Thank you.
