Comments: I fully support the logging of Telephone Gap. Acadian forests have evolved over thousands of years to rely on disturbances. Indigenous people/Abenaki actually used to purposely set forest fires in order to promote early successional growth and improve wildlife habitat not only for game animals but the thousands of other mammals, reptiles, songbirds and insects that rely on young forest. What any northern New England wildlife biologist will tell you is that in the absence of forest diversity and especially in a mature forest monoculture you'll actually get what they call wildlife "deserts".

The point here is we need forest diversity, and to accomplish that and in the absence of fire, we need to cut some trees. Please do not cave to misinformed individuals and organizations. Log it!
