Comments: Hi,

Intense wildfires, like the Antelope and Tennant events cause high severity burns. This is noted in the project proposal as 57% of the total acreage burned. How does logging the live and dead trees that remain in that roughly 43% of acreage help to avoid high severity, extreme wildfire events, in the coming decades? Are the actions being taken in this project going to help the forest in the next 100 years, or help the economy in the next 10? Over and over I hear that salvage logging is very destructive and "antithetical to rapid recovery." What does the "no action" plan look like and where can I read about that? Thank you.
