Comments: Cbmjournal.biomedcentral.com : Carbon Balance and Management Conclusions: Achieving a global, economy wide "balance between anthropogenic emissions and sources and removals by sinks" will require both more emission reductions and more carbon sequestration from the forest sector.

The proposed cutting in Telephone Gap will release about as much carbon into the atmosphere as the Burlington McNeil Biomass plant does in a year. This is the exact opposite direction from which we should be striving to move.

The Telephone Gap area should be considered a carbon sink and should be preserved.
