Comments: Eco watch/Keeping Trees in the Ground-A low tech way to slow climate change, February 24, 2021. The Forests pulls 1/3 of human caused co2 out of the atmosphere. Ending deforestation could enable forests to take up twice that much. Live and dead trees and forest soil hold the equivalent of 80% of all carbon currently in Earth's atmosphere.

It is false that wood products store carbon in a way that a live tree does, because that does not count cradle to grave emissions from logging and manufacturing.

And besides, the proposed timber harvest in TG will be 60% pulpwood, not products such as tables and chairs. The Executive Order to inventory and conserve all old forests is meant to be an immediate way to continue to sequester carbon, as we develop additional technologies to reduce emissions in transportation, heating and manufacturing.
