Comments: Anthropogenic Rapid Climate Change (ARCC) needs to be incorporated into Purpose and Need. Alternatives will need to be developed around this Need as supported by the risk levels described in the F.S. Climate Adaptation Plan (FS-1196)

I would ask that a carbon budget be developed for each alternative and operational conditions developed that would ensure the utilization of current technologies.

The next decade will have land management priorities adjusted for this project area and reflected in individual project designs. The goals of these projects will be properly functioning watersheds considering predicted stressors from Climate Change.

These are different times and the bottom line is to develop projects that are appropriate for the area considering modeled future conditions and contribute to our national goals of Greenhouse Gas reductions.

Thank You.
