Comments: I fully support this project. I feel that the lack of early successional habitat is a contributing factor to the decline of the ruffed grouse in the Daniel Boone NF as well as contributing factor to this species decline in Kentucky. This project addresses this issue. I also think this project will benefit other species in the Daniel Boone NF that depend on a mix of early successional habitat such as the wild turkey, american woodcock, whitetail deer, whippoorwill to name a few. This project is long overdue and will help address the needs of an underserved user group of the Daniel Boone NF, the "upland bird hunter"
