Title:

Comments: Since this project would allow a TSF on one side of the East Boulder and a WRSF on the other, rising several hundred feet, care must be taken to ensure that a stable land form is achieved and that state of the art geomorphic reclamation design be accomplished protecting the pristine water quality upon closure and blendsng into the topography and existing natural terrain and vegetative cover upon completion. The 30 day window for creating that geomorphic design is not realistic and should entail considerable study and comparison to the BAT for such work.

Long term closure bonding to ensure these objectives is paramount.
