Title:

Comments: Dear sirs , I am writing today about logging project 57341. The scientific study done by Bradley, handsome and Delasala 2016 clearly demonstrates that your proposed logging projects will increase the severity of forest fires in the treated areas. Please read the study. Hansen also wrote a book called smokescreen, which I also recommend. Treatment should be limited to around homes and infrastructure. Wind, driven forest fires will burn the treated areas more thoroughly, and put more carbon into the air if they are thinned. If you have ever tried to light a fire with a dense pile of kindling, as compared to a Loose pile of kindling you will have a good idea what I am trying to describe. Please read that study. Thank you, Andy Roubik .
