Comments: Please accept these comments for this ridiculous project on the FNF.

Once again the USFS has done a great job to continue their trend in mismanaging the public trust in logging, roading and harming the landscape on a massive scale. Treating thousands of acres with logging taken in tandem with past projects near the project degrades the landscape to a point that it may never recover from the harm inflicted.

There needs to be an EIS done to identify the harms that are a result of this terrible timber sale. The main purpose of this project is to cut trees, degrade habitat, ruin soils, harm water quality and spread weeds.

The FNF has talked for years about creating some programmatic protocol for dealing with weed spread and after 25 years have done nothing on this.

Maintaining habitat for endangered and sensitive species? We really have no clue on how to do this because our industrial logging does not provide for this concept.

We accept harming the landscape with logging and road building. We are a scofflaw agency. We lose lawsuits all of the time, but we will not change our ways. We just rewrite the rules with our new forest plan. This plan is beneficial for industrial logging. We ignore amendment 19, we resist protecting water quality. We ignore any actions that would promote endangered species, soil quality, water quality, take roads away, create secure wildlife habitat.

How much carbon will this plan emit?

Has the forest done oldgrowth mapping. Has the forest created maps to show oldgrowth recruitment?

There is no way that the forest can prove with science and new research that this project will reduce wildfire and create a resilient forest, whatever this term means.

The best thing you could do is just go home, stop this madness. I would be supportive if you still got paid to do no

more harm. Please try on project without the industrial logging. The forest can long survive with this short sighted plan.

Please do the right thing and put this plan in the trash can. Future generations and the landscape, water quality and soil health will thank you. The non-logged trees will too! I will too! I really do not know how you can sleep at night.

Thanks for not much,

Stephen braun
