Comments: As a New Hampshire resident who spends many hours hiking and hunting in the woods of New Hampshire, I want to commend and support the Sandwich Vegetation Management Project #57392 as proposed. Biodiversity is important in the management of our forests for the habitat of many species. This proposed plan will help that diversity to be achieved without any concern about climate change, because the cutting of 145 acres in a state with an estimated 4,708,302 wooded acres would simply not make a difference when considering the local or global concerns about climate change.
