Comments: This is a crisis point in time for the health and quality of our air. Natural forests are our planet's air purification system and this policy is critical for the future of our physical health and the environmental health of the planet. There is just too much logging statewide, nationwide, and worldwide. In addition, the lumber that is wasted during construction and demolition is abhorrent. You should spend some time at any construction site or watch a new subdivision being built. How about spending time at your local landfill and see the wood construction waste being callously discarded. If logging is managed properly with conservation considered, our forests wouldn't be in this debilitated situation. With proper forest logging management, purchasers of wood would be frugal in their usage. I'm confident we would have less wood in our landfills and more efficiency in it's usage. With reduce and reuse part of the process.. This policy is way overdue. This must proceed and this bill must be passed. Thank you for this magnificent effort.
