Comments: With the outbreak of CWD, America's elk and deer populations are at risk. As much as I love and appreciate the National Elk refuge, this site is a potential breeding ground for CWD. With the winter of 2022/2023 wiping out a large number of Western Wyoming's Mule Deer and Antelope populations, the area's wildlife has taken a large hit. This includes elk unfortunately, and with CWD on the rise, I fear that Elk, Deer, and Antelope will be hit by CWD soon. In this case, specifically the elk population. While the elk feed ground does help wintering elk, it also has the possibility to wipe out hundreds if not thousands of elk. The reality is, Wyoming's cervid population is in extreme danger if the Wyoming game and fish doesn't do something about it. Farmers, ranchers and all the folks who live in the great state of Wyoming, including myself, need to do something about our big game soon, or there won't be any game left for this generation, or the next. Not only will this cause immense stress on the environment, it will ruin this great state's hunting, fishing, and outdoor recreation.
