Title:

Comments: Hi - I'm 13 years old and climb and live in Bishop near several wilderness areas. I've pasted some comments below which I agree with; but I want to say that having safe anchors in wilderness is really important for my future. As I keep climbing for years and years, the safety of anchors will degrade under this policy and will become dangerous to me. It's pretty obvious that you haven't really thought this through, and if you want people to keep supporting your agencies to get funding, you should listen to the people that actually use your areas and support you.

*Amid increasing usage of wilderness climbing routes, prohibiting service and installation of pitons, bolts, slings, and other fixed hardware would create a worsening public safety issue.

oRappelling is the primary cause of death in climbing accidents. When climbers rappel, they rely on a single anchor, and anchor failure during rappelling often results in death.

oProhibiting the maintenance of anchors or placing bolted anchors increases the risk of anchor failure.

oWithout the ability to leave behind equipment or modify existing slings or pitons, climbers will be encouraged to trust the existing gear left exposed to weather over the years.

oThe proposed directives FSM 2355 will exacerbate an already significant threat to the climbing public who use USFS wilderness to climb.

*Aging hardware makes climbing routes and descents less safe, which causes more accidents. This would increase demand on already overworked volunteer Search and Rescue (SAR) organizations.

oThe new directives will make existing routes more hazardous by discouraging maintenance of bolts and anchors.

oVolunteer SAR organizations are overworked because of increasing usage of wilderness. Proposed directives FSM 2355 would create even more demand on SAR.

oRappelling off of bolts or fixed anchors is often the only option for climbers to self-rescue before activating SAR resources.

oThe proposed directives would prevent climbers from safely retreating from routes without SAR rescue, for example during inclement weather

*The language in the new directives does not clarify whether volunteer SAR members would be permitted to place and determine the location of emergency rescue bolts.

oSection 2355.03 paragraph 7 states that local government officials may determine if hardware is necessary for emergency purposes. However, volunteers typically make this determination with SAR groups. This language opens the possibility that SAR volunteers might be acting illegally while performing normal rescue operations. Volunteer SAR operates the majority of rescue operations in the Sierra Nevada mountain range.

*Bolts and fixed rappel stations prevent resource degradation in fragile alpine environments.

oProhibiting fixed anchors encourages climbers to rappel off of trees and bushes, which can eventually kill cliffside vegetation.

oBolted anchors reduce trampling and social trail creation in delicate alpine environments by directing all climbers to a single location.

*Proposed directive FSM 2355 will encourage the creation of dangerous new routes.

oDiscouraging bolt placements will make certain belays more dangerous.

oOn wilderness routes, bolts are already placed sparingly. In situations where no removable gear can be placed, bolts are placed to prevent catastrophic falls. Prohibiting these bolt placements will lead to more catastrophic falls in the wilderness and more SAR rescues.

*FSM 2355 has no plan to support increased staffing to document all existing hardware and enforce these regulations.

*Many routes require rappelling in some form.

oRappels typically require leaving behind some form of equipment

oIn the Wind River Range (Shoshone National Forest) climbers are encouraged to only leave behind gray, rock colored slings, and to clean-up any old slings left behind under boulders.

oEven this hardly visible, self-regulated form of descent would be not permitted under the proposed directive.
