Comments: As you must know from news reports, weather disasters are increasing in frequency and intensity; and they're costing us billions of dollars. If we don't stop carbon emissions soon, we'll be facing a climate catastrophe that could be difficult for us to recover from. Moreover, the U.S. is currently the leading producer of oil and gas. Fossil fuel producers are making billions, but they haven't yet effectively capped the orphaned wells that emit large amounts of methane, the most harmful of the carbon emissions. The U.S. needs to stop drilling new wells and make greater progress in capping the ones that are now out of service. A 20-year moratorium on new drilling is a necessity now. Please don't open up any areas in Colorado to more drilling. Thank you for your public service.
