Comments: This is a great project and long overdue, in my opinion.

I know there are many interconnected resource values that you have to balance and many stakeholders that you must consider their input. Too me, your key message should convey that the existing conditions have significantly departed from historical (pre euro settlement) range of variability and are not sustainable, and the risk of catastrophic, stand replacement wildfire is very high and inevitable. When this occurs all resource values will be seriously compromised.

To me it is obvious that tons of biomass per acre must be removed and not all will be marketable as traditional sawlogs of which there is already a limited market My question is: are you considering an Air Curtain Burner CharBoss as an alternative to convert slash and small logs to BioChar ?

I know the USFS as/is working with Air Curtain On the development of the CharBoss and I strongly recommend OWNF Consider this as an alternative for the Swauk.

Please feel free to let me know

Thank you
