Comments: It is very important the Forest Service actively manage forests in non-sensitive areas to reduce the wildfire risk (fuels reduction / treatment), restore forest health, reduce the impacts from insect / disease / weather events. This is especially important in the WUI,(wildland interface). The Forest Service will not get a handle on destructive fires until the FS is proactive. A do nothing policy is bad management. I can not summarize it better:

<https://www.youtube.com/embed/THNW3z7dV9E>

Additionally, the FS needs to restore their old seed orchards to address the huge reforestation problem.
