Comments: If any clean up is to be done of dead plant life, it should be done by hand and placed in piles to compost, allowing the replenishment of soil, to grow a more healthy forest, sustaining the air and protecting our water source from drought.

Clean up and care for the trees should be done by members of the public for free as to promote deflation in our economy. This shows the work gets done and the end result is what is worth, taking away the grandiose tendencies of those who feel their work is worth more than it is and making it easier to get people to do the right thing based on the radiation of the shape of these trees and its effect on the shape of thought in the community. Promote taking care of cleaning up dead plant life by hand and putting it into compost piles. This will mitigate fire hazards, replenish the soil, and lessen the surface area that absorbs the water at the top layer (mitigating evaporation. I have found this type of movement, if done by hand, creates a water source, as it has been found to be scientifically conclusive to create rainfall, due to compression and radiation of photons and other chemicals. (Creation of a water source in a drought)
