Comments: Old growth forrest is imperative for biodiversity. Many types of wildlife live only in old growth including many species of bird. There is no reason to log old growth as secondary growth can be used just a s well.

Clear cutting also has no real purpose also as it wipes out whole areas which are homes to many species. Even when cutting is done that is not "clear cutting" but select cutting the small number of trees left is pitiful and it is select logging only in name.

These old Forrests have been in existence for longer then most human populations and will not be regenerated for longer then any of us will be alive. Trees 100-600 years old should be treated with the respect you would give an elder. Strict regulations should be enforced and should be the norm everywhere-especially in the Americas where they are more prevalent.
